Adobe offers two unique features or capabilities in Photoshop: Transform and Adjustment Layers. The difference between them is that a Transform Layer allows a change to an object's physical dimensions (such as stretch, slant, or rotation) without any change to the object's apparent shape. An Adjustment Layer, in contrast, allows a change to the object's appearance, including color, brightness, contrast, and opacity. The Transform Layer works with the Adjustment Layer, but the Adjustment Layer can't be applied to a Transform Layer. Transformations can be applied simultaneously to multiple objects and can be applied over a group of Adjustment Layers, or in conjunction with a Gradient Map. Motion Blur is an advanced feature for compositing videoplanar images. Photoshop Motion Blur works with Selections by applying an appropriate lens blur to a subtle or dramatic motion, helping to enhance movie or video elements. Photoshop has up to seven Levels layers. Each layer serves a particular purpose. The Background layer is the base of your image. Layers include any objects you've added, as you will see later. Layers allow you to combine elements into a single page in a manuscript document, or combine a variety of elements into a single image. Before you can add more layers, you must first add an active layer. Live Adjustment Layers provide an additional layer of precision controls over a layer so you can manually edit any part of your image with ease, in real time. You can apply effects while they are live with live filters, which change the appearance of a layer in real time as you adjust the sliders, let you see the results of your adjustments, and animate your changes as each adjustment finishes. You can also animate all the adjustments in a layer, blending them into one final image.
